

# Metodologie AGILE nello sviluppo di medical device software

Marco Prattichizzo  
Campus di Ingegneria, Cesena  
21 Novembre 2019

# Overview

- ▶ AGILE
- ▶ Regulations
- ▶ AGILE in Medical Device Software
- ▶ Waterfall --> Agile
- ▶ Conclusion

# Introductions First

**Laurea Magistrale  
in Ingegneria  
Biomedica  
(Cesena)  
Luglio 2012**

Tesi “Caratterizzazione  
Quantitativa delle  
Curve Tempo-  
Concentrazione nella TC  
perfusione polmonare»

**Mirada Medical  
(Oxford, UK)  
Febbraio 2014**

Internship  
Test Engineer  
Analyst

**Vision RT  
(Basingstoke, UK)  
Maggio 2019**

Quality Engineer

**Optellum  
(Oxford, UK)  
Novembre 2019**

Analyst/Test Engineer

# What is AGILE?

# What is AGILE?

*A framework of principles and practices used by collaborative teams to rapidly and frequently deliver customer valued software that satisfies business needs*

# AGILE Manifesto

## **Manifesto for Agile Software Development**

We are uncovering better ways of developing software by doing it and helping others do it.  
Through this work we have come to value:

**Individuals and interactions** over processes and tools  
**Working software** over comprehensive documentation  
**Customer collaboration** over contract negotiation  
**Responding to change** over following a plan

That is, while there is value in the items on the right, we value the items on the left more.

# Roles and Responsibility

## Product Owner

- Defines the features of the product
- Manages product backlog in priority order
- Represents all stakeholders' needs
- Accepts or rejects the product

## Scrum Master

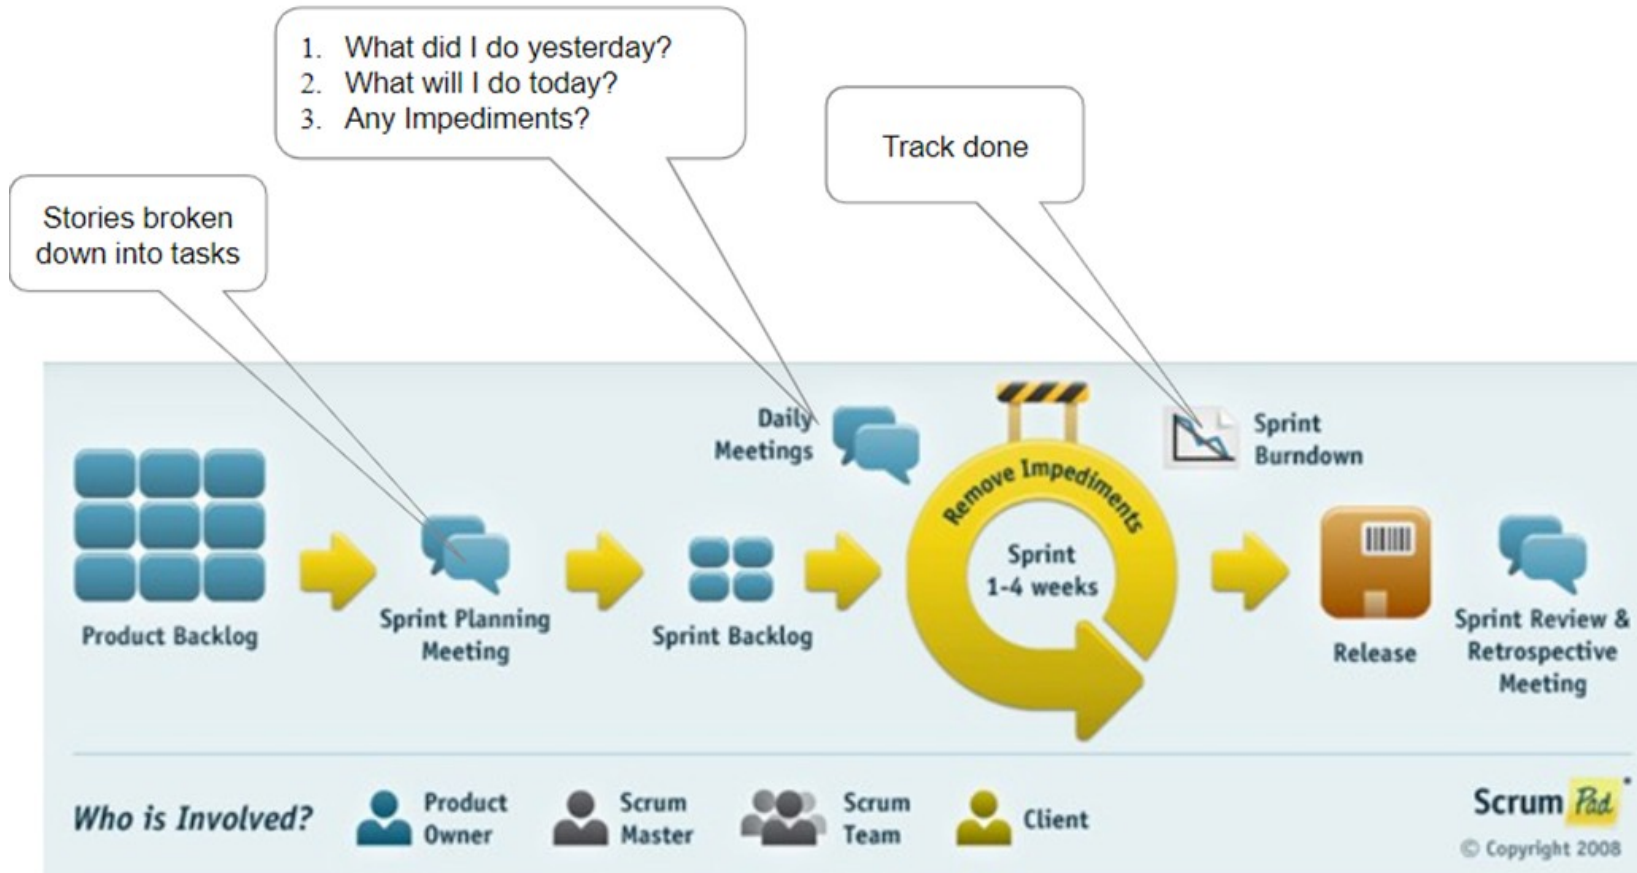

- Remove impediments to allow the the team to make progress at constant/desired pace
- Facilitates communication/interaction among all parties
- Promotes scrum values and practices

## Development Team

- Cross functional and 5-9 in size
- Performs the actual development work
- Decides on how works gets done
- Responsible for managing the sprint backlog and meeting the self-defined target

# Scrum

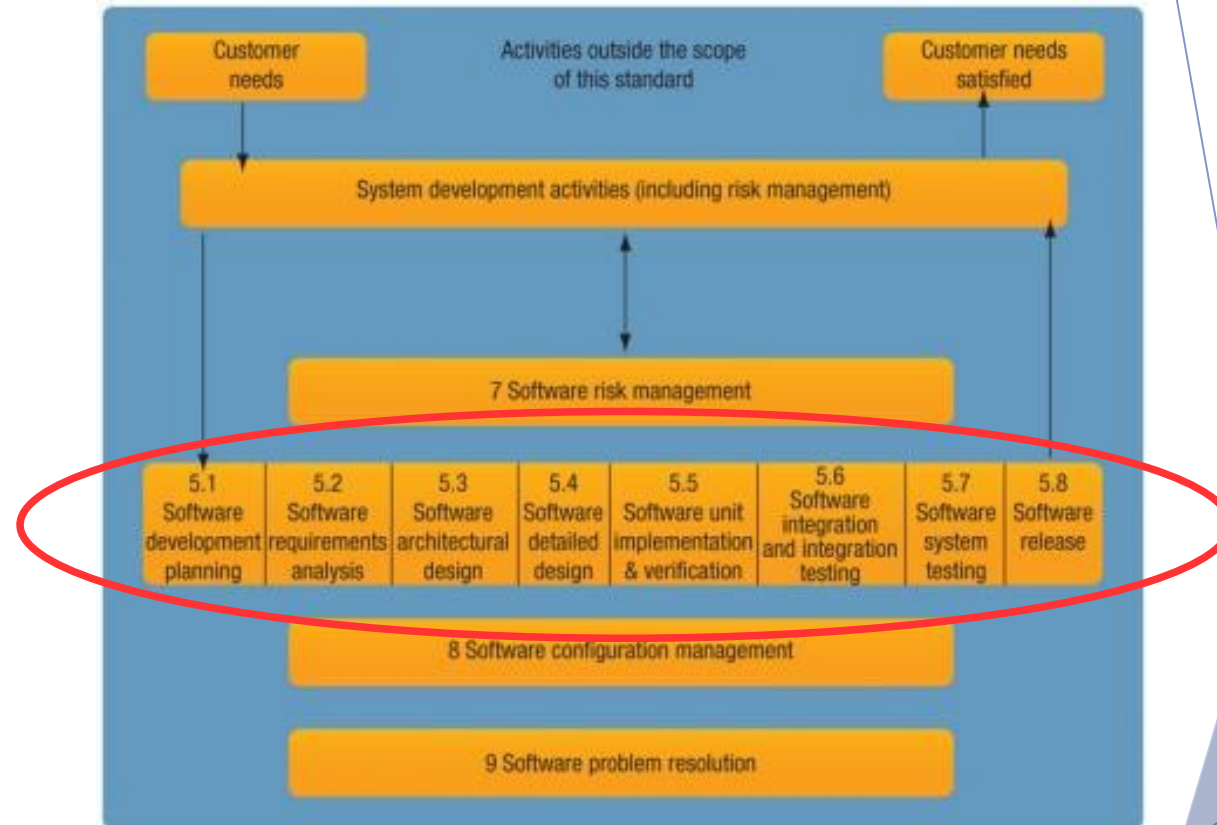

# Regulations

- ▶ EU: MDR (MDD)
- ▶ USA: FDA 21CFR820
- ▶ IEC 62304 Medical Device Software - Software Life Cycle Processes
- ▶ ISO 13485 Medical devices -Quality Management Systems - Requirements for Regulatory Purposes
- ▶ ISO 14971 Medical Devices - Application of Risk Management to Medical Devices

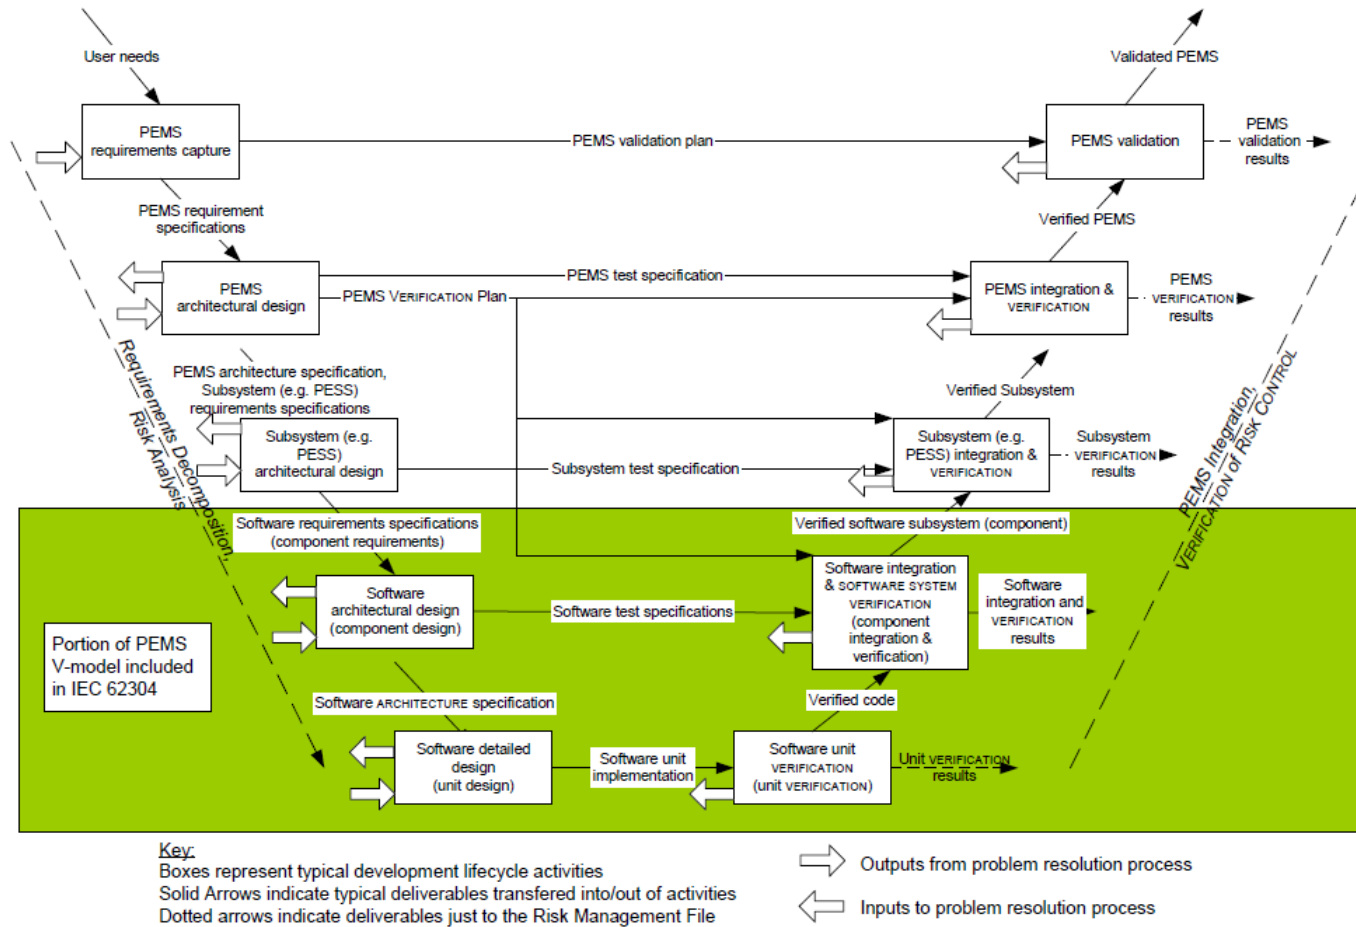

...

# IEC 62304

1. Scope
2. Normative References
3. Terms & Definitions
4. General Requirements
- 5. Development Process**
6. Maintenance Process
7. Risk Management
8. Configuration Mgmt
9. Problem Resolution

# IEC 62304 V-Model

IEC 726/06

Figure C.2 – Software as part of the V-model

# AGILE VS Medical Device

## Manifesto for Agile Software Development

We are uncovering better ways of developing software by doing it and helping others do it.  
Through this work we have come to value:

Individuals and interactions over processes and tools

Working software over comprehensive documentation

Customer collaboration over contract negotiation

~~Responding to change over following a plan~~

That is, while there is value in the items on the right, we value the items on the left more.

## Won't do

- Doesn't allow developers to hack code any way they want without docs
- Won't increase development productivity overnight
- Won't let product managers get everything they won't

## Will do

- Give clear visibility on progress
- Show where the problems are and drives continuous improvement
- Lets product owners decide on what is most important and adapt ideas
- Deliver highest values features

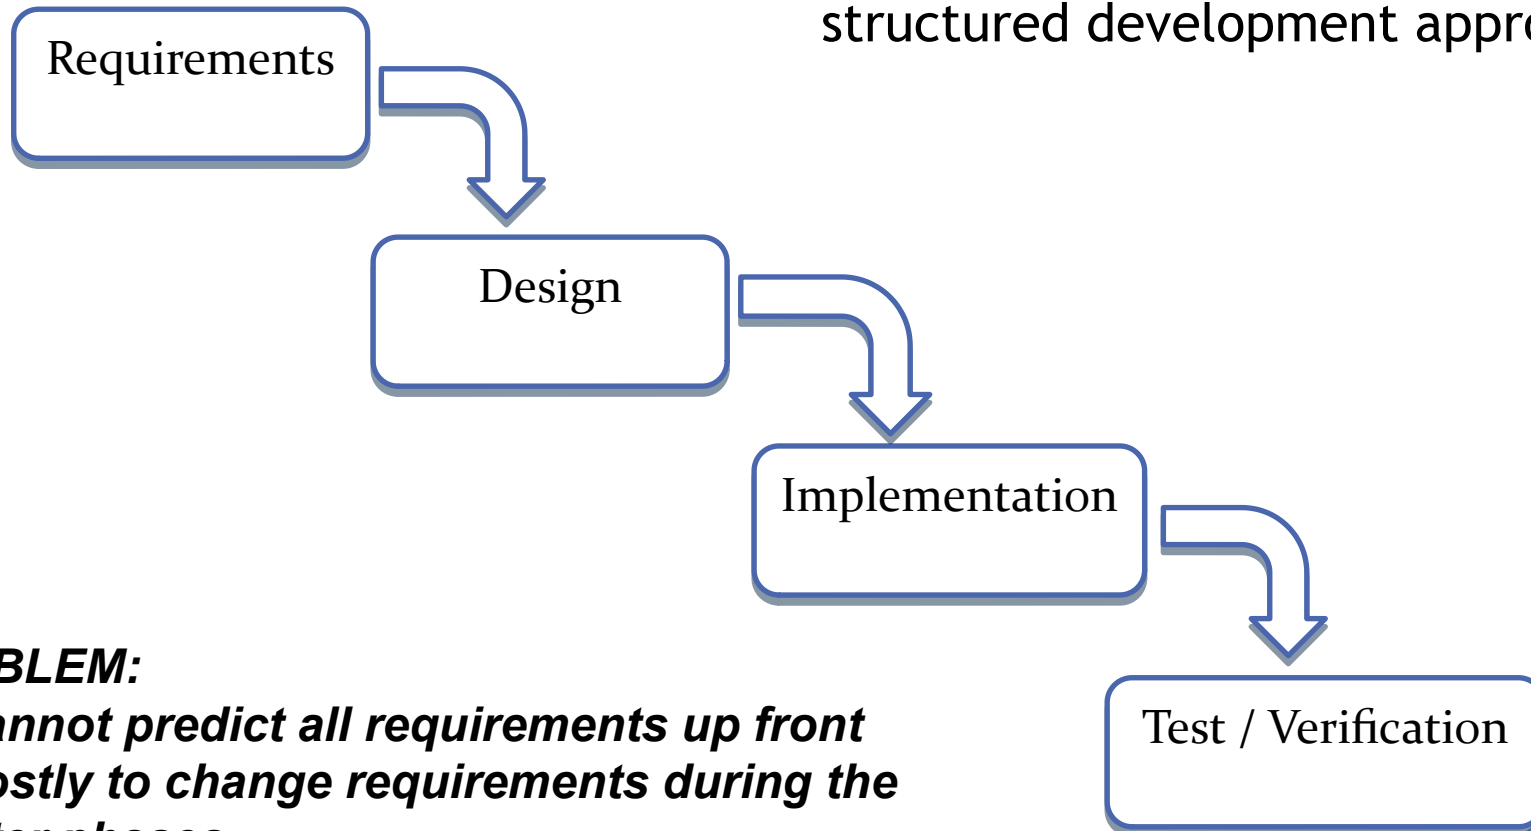

*"Is not a euphemism for no documentation, it is a disciplined project process that requires planning and communication"*

# Mirada Medical - From Waterfall to AGILE

- ▶ Small engineering team 20-25 people
  - ▶ Strong academic and scientific culture
  - ▶ Highly experienced in medical imaging
  - ▶ Skepticism of AGILE
- 
- ▶ 2-3 product lines with 3-9 month releases
  - ▶ Minimal tooling and devops support
  - ▶ Primarily manual testing

# Waterfall

Waterfall became popular as a more structured development approach

**PROBLEM:**

- *Cannot predict all requirements up front*
- *Costly to change requirements during the later phases*

# Development Driven Development

Step 1 - Cross functional Design session

Step 2 - Rapid Prototyping / Development

Step 3 - Requirements, tests, code

## Key Points:

- ▶ Help enable early user feedback
- ▶ Proof of concept to reduce technical uncertainty
- ▶ Improved communication - more effective concept reviews
- ▶ Better alignment between reqs, test and product
- ▶ Does not mean skipping reqs and design
  - ▶ Requirements analysis evolves and refines design
  - ▶ Test makes the design more robust

# What Which Why How?

- ▶ How do we implement AGILE?
- ▶ How does AGILE relate to Mirada development process (QMS)?
- ▶ Why AGILE?
- ▶ How does AGILE fit with medical device regulated development?
- ▶ Which AGILE flavor?

# Challenges

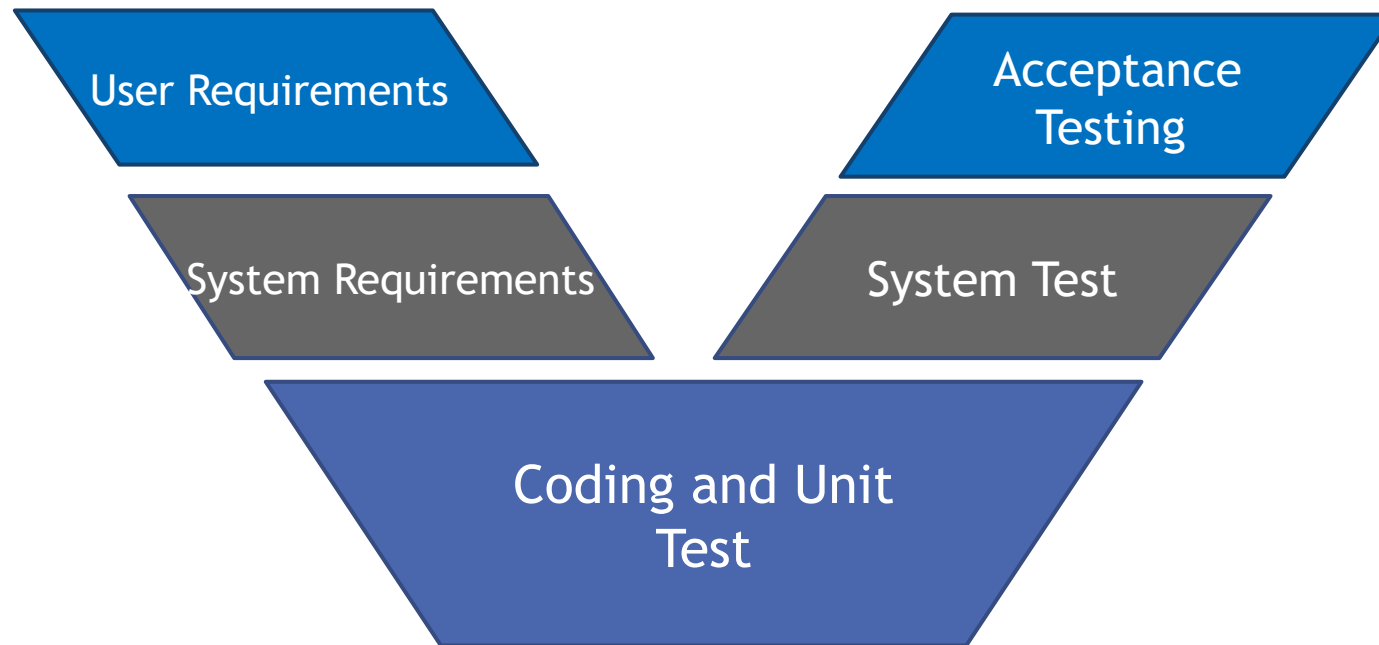

- ▶ Volume of documentation
- ▶ High overhead for each release
- ▶ Not ready to release until tested
  - ▶ Releasing is costly
- ▶ Tying development to requirements is hard
- ▶ Risk management
- ▶ Do we want scope scope flexibility?
  - ▶ Scope change is an overhead
- ▶ There is a minimum scope to make a release
  - ▶ Cost to customer to update
- ▶ Why sprints?
  - ▶ Sprint could be harmful for small teams, they just add barriers

# Experiment and adapt

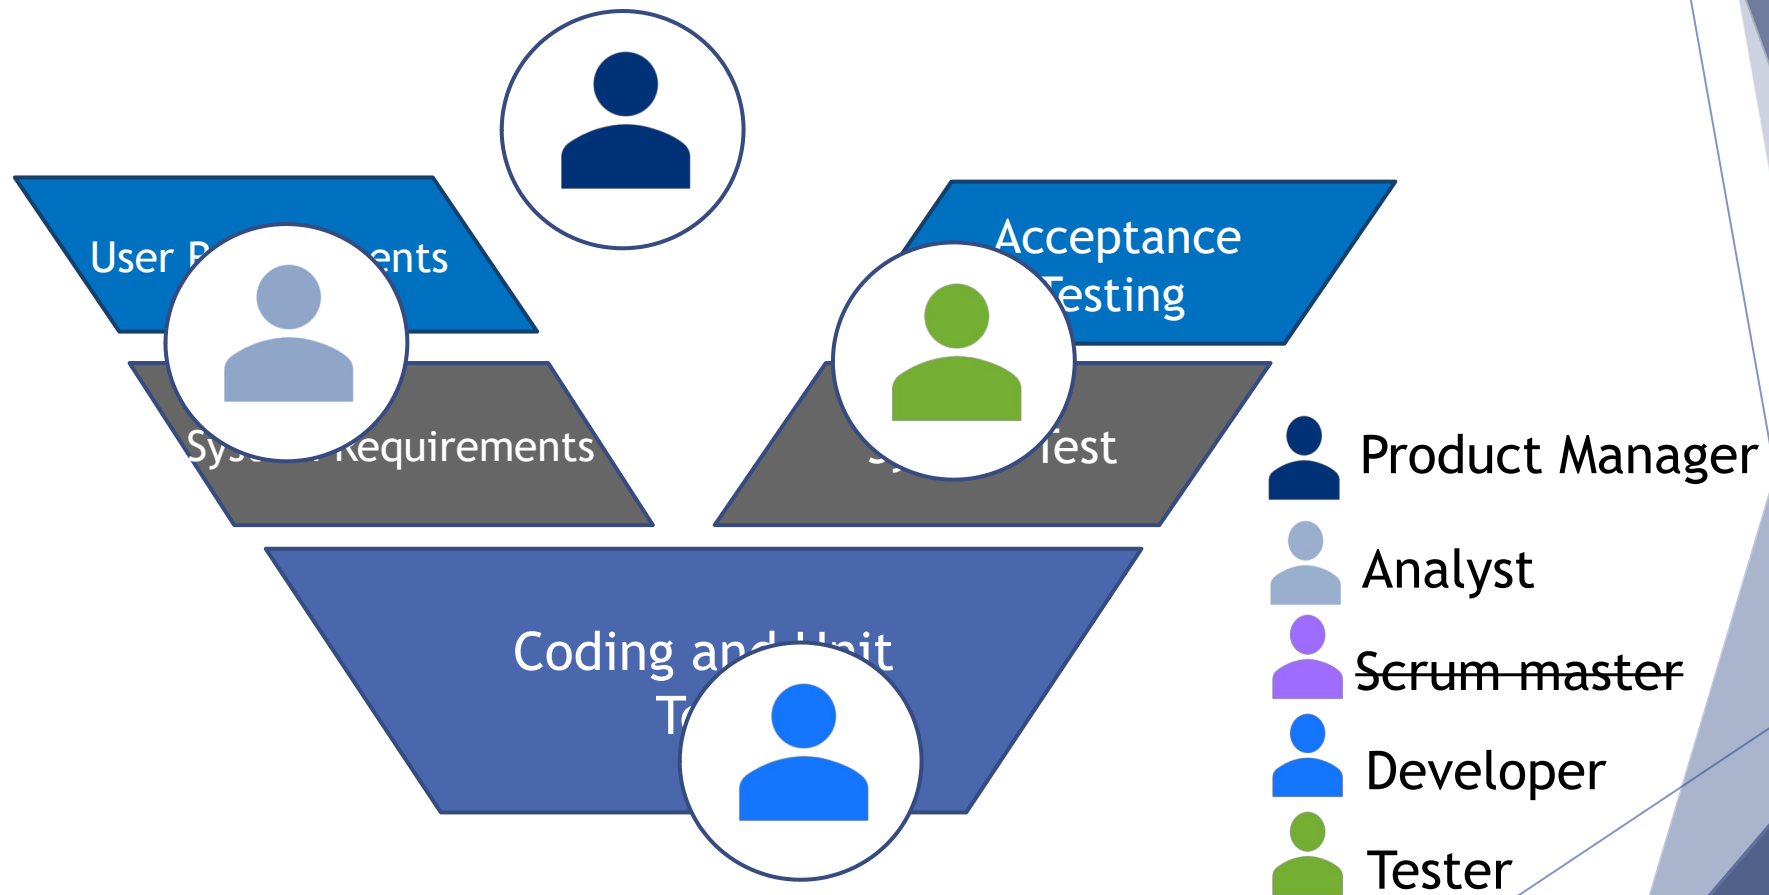

- ▶ Several workshops ran by the software developer manager involving all development team (analysts, testers, developers, architects ecc...)
- ▶ New updated processes not imposed but results of collaborative efforts
- ▶ Continuous improvement
- ▶ Retrospectives

# Micro AGILE Team Setup

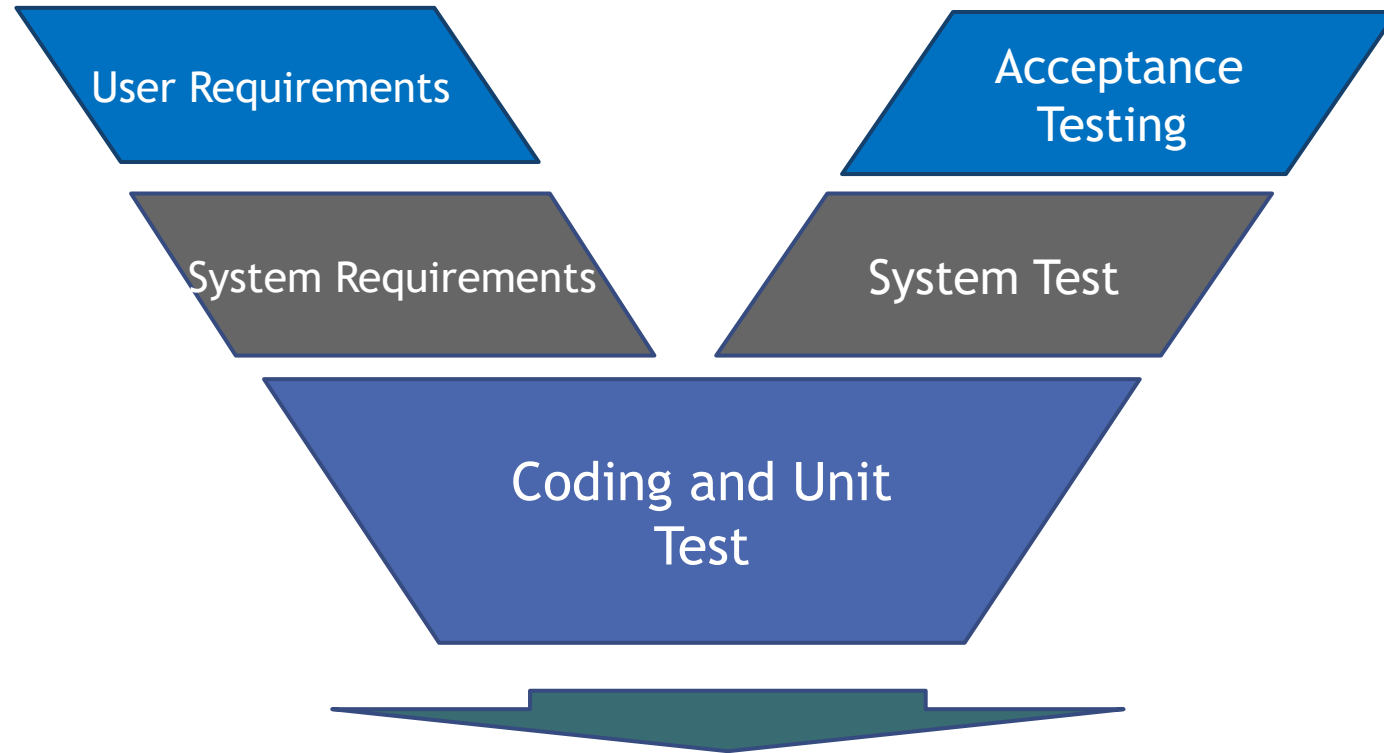

# Micro AGILE Team setup

\*Multi-skilled people

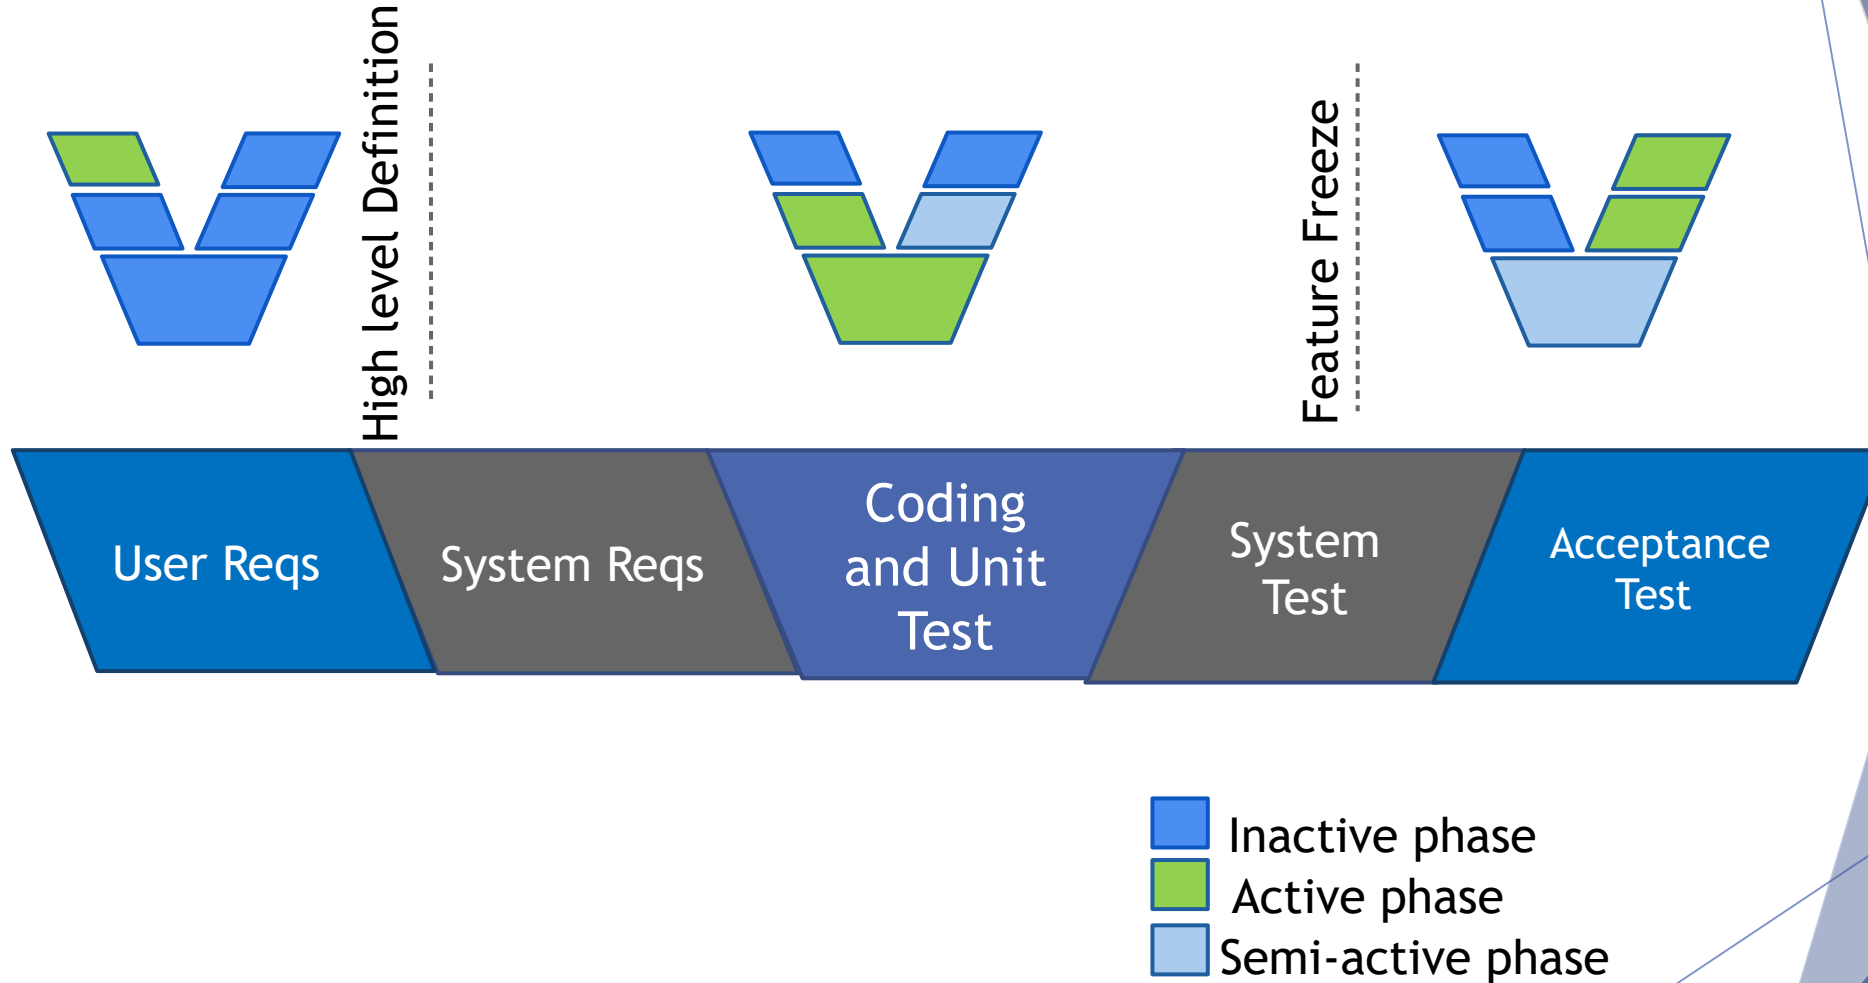

# V-model

# Agile in V-model (Wateragilefall)

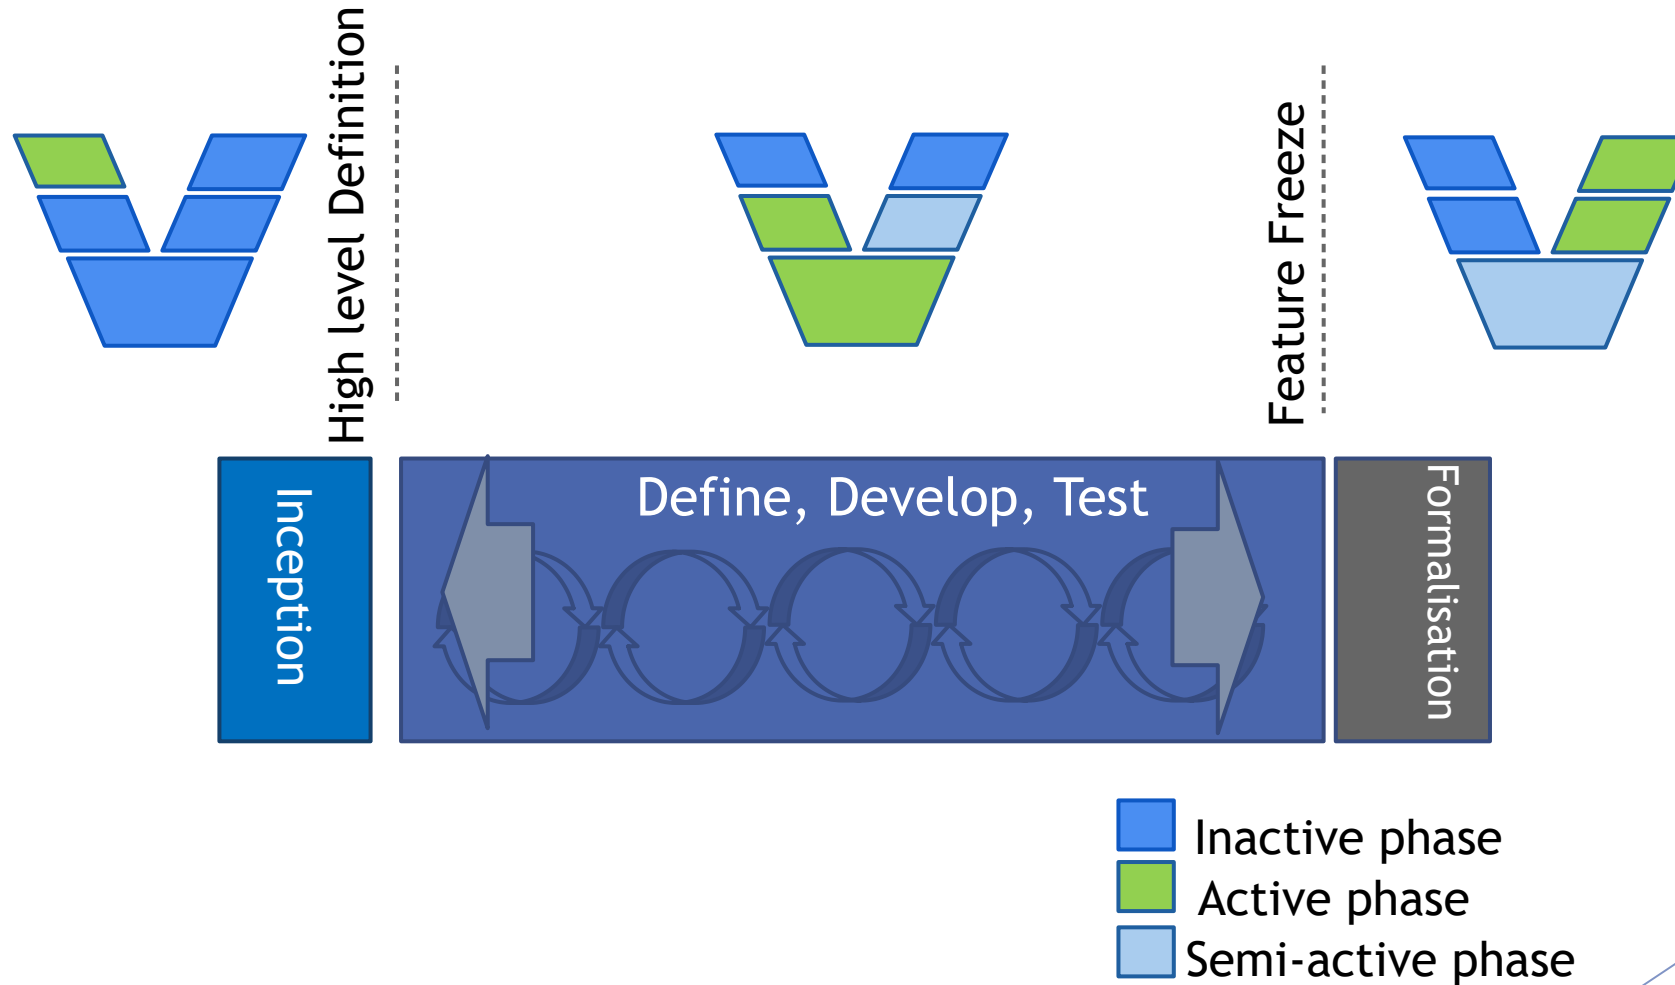

# Agile in V-model (Wateragilefall)

# Agile in V-model (Wateragilefall)

# Lesson Learned

- ▶ Micro AGILE team weaknesses
  - ▶ Higher impact from missing team member
  - ▶ Difficult to scale
  - ▶ Lack of cross team interaction - divergence, waste
  - ▶ Limited functional peer level support

# Lesson Learned

- ▶ Project retrospectives helped identify pain points
- ▶ Piloted improvement idea (Kanban) on new major project
- ▶ Positive results:
  - ▶ Product backlog
  - ▶ Design sessions
  - ▶ Pair Programming
- ▶ Complaints about daily stand-ups (too many meetings) but:
  - ▶ Main goal of daily stand-ups is to increase day-to-day communication
  - ▶ Communication/collaboration already strong
- ▶ Development Driven approach encourages early feedback and improve communication
- ▶ You can't force adoption of AGILE and expect to get the right mindset
- ▶ Experiment and adapt (flexible QMS)

# Lesson Learned (Challenges)

- ▶ Volume of documentation
  - Right tool, sum of the parts documentation
- ▶ High overhead for each release
- ▶ Not ready to release until tested
  - final INCREMENT to complete the final tasks needed to produce shippable software
- ▶ Tying development to requirements is hard
- ▶ Risk management
  - Included in *donness* criteria
- ▶ Do we want scope scope flexibility?
  - Change control
- ▶ There is a minimum scope to make a release
  - Backlog MVP line
- ▶ Why sprints?
  - ▶ Sprint could be harmful for small teams, they just add barriers

# Vision RT

- ▶ Big development team ~100 people, 3 offices (2 UK, 1 Poland)
- ▶ Big AGILE team ~9 people
- ▶ 2 main product line with 6-12 month release cycle
- ▶ 3 week sprint
- ▶ Rigid structure
- ▶ Detailed AGILE process in QMS

# But...

- ▶ Team under pressure, implement features as quickly as possible
- ▶ Frequent scope/feature changes (loose change control)
- ▶ Documentation tool difficult to use and not fit for AGILE
- ▶ Silos teams (developers, testers, product owners), little communication
- ▶ Backlog items done with no documentation
- ▶ Documentation (detailed design requirements) done all at the end of the project (just to meet regulatory requirements)
- ▶ >250 detailed design requirements created after implementation (with no trace to tests)!

# There isn't a magic formula for AGILE

- ▶ Process ownership
- ▶ Continuous improvement
- ▶ Clear definition and rigid application of *doness* criteria (including QMS requirements)
- ▶ Useful documentation
- ▶ Change management process
- ▶ Communication
- ▶ **Being** AGILE, not *doing* AGILE
